## Introduction

Consider the impulsive functional differential equation

$$
\left\{\begin{array}{cc}
x^{\prime}(t)=f\left(t, x_{t}\right), & t \neq t_{k} t \geq t_{0} \\
\Delta x=I_{k}\left(t,\left(x_{t}^{-}\right)\right), & t=t_{k}, k \in Z^{+} \tag{1}
\end{array}\right.
$$

Where $\quad f: J \times P C \rightarrow R^{n}, \Delta x=x(t)-x\left(t^{-}\right), t_{0}<t_{1}<\cdots t_{k}<t_{k+1}<$ $\cdots$, With $t_{k} \rightarrow \infty$ as $k \rightarrow \infty \quad$ and $\quad I_{k}: J \times S(\rho) \rightarrow R^{n}$, where $J=\left[t_{0}, \infty\right)$, $S(\rho)=\{x \in R:|x|<\rho\} . P C=P C\left([-\tau, 0], R^{n}\right)$ denotes the space of piecewise right continuous functions $\varphi:[-\tau, 0] \rightarrow R^{n}$ with sup-norm $\|\varphi\|_{\infty}=\sup _{-\tau \leq s \leq 0}|\varphi(s)|$ and the norm $\|\varphi\|_{2}=\left(\int_{-\tau}^{0}|\varphi(s)|^{2} d s\right)^{1 / 2,}$ where $\tau$ is a positive constant, $\|$.$\| is a norm in R^{n} . x_{t} \in P C$ is defined by $x_{t}(s)=$ $x(t+s)$ for $-\tau \leq s \leq 0 . x^{\prime}(t)$ denotes the right-hand derivative of $x(t) . Z^{+}$ is the set of all positive integers,
Let $f(t, 0)=0$ and $J(0)=0$, then $x(t)=0$ is the zero solution of ( 1 ). Set $P C(\rho)=\left\{\varphi \in P C:\|\varphi\|_{\infty}<\rho\right\}, \forall \rho>0$.

## Definition 1.1

Let $\sigma$ be the initial time, $\forall \sigma \in R$, the zero solution of (1) is said to be
a) stable if, for each $\sigma \geq t_{0}$ and $\varepsilon>0$, there is a $\delta=\delta(\sigma, \varepsilon)>0$ such that, for $\varphi \in P C(\delta)$, a solution $x(t, \sigma, \varphi)$ satisfies $|x(t, \sigma, \varphi)|<\varepsilon$ for $t \geq t_{0}$.
b) uniformly stable if it is stable and $\delta$ in the definition of stability is independent of $\sigma$
c) asymptotically stable if it is stable and, for each $t_{0} \in R_{+}$, there is an $\eta=\eta\left(t_{0}\right)>0$ such that, for $\varphi \in P C(\eta), x(t, \sigma, \varphi) \rightarrow 0$ as $t \rightarrow \infty$
d) uniformly asymptotically stable if it is uniformly stable and there is an $\eta>0$ and, for each $\varepsilon>0$, a $T=T(\varepsilon)>0$ such that, for $\varphi \in$ $P C(\eta),|x(t, \sigma, \varphi)|<\varepsilon$ for $t \geq t_{0}+T$

## Definition 1.2

A functional $V(t, \varphi): J \times P C(\rho) \rightarrow R_{+}$belong to class $v_{o}($.$) ( a set$ of Liapunov like functional) if
a) $V$ is continuous on $\left[t_{k-1}, t_{k}\right) \times P C(\rho)$ for each $k \in Z_{+}$, and for all $\varphi \in P C(\rho)$ and $k \in Z_{+}$, the limit $\lim _{(t, \varphi) \rightarrow\left(t_{k}{ }^{-}, \varphi\right)} V(t, \varphi)=V\left(t_{k}{ }^{-}, \varphi\right)$ exists.
b) $V$ is locally Lipchitzian in $\varphi$ in each set in $P C(\rho)$ and $V(t, 0)=0$ The set $\Re$ is defined by $\Re=\left\{W \in C\left(R_{+}, R_{+}\right)\right.$: strictly increasing and $W(0)=0$
Main Results Theorem 1

Assume that there exist $V_{1}, V_{2} \in v_{0}(),. W_{1}, W_{2}, W_{3}, W_{4} \in \Re$ such that
I. $W_{1}(|\varphi(0)|) \leq V(t, \varphi) \leq W_{2}(|\varphi(0)|)$, where $V(t, \varphi)=V_{1}(t, \varphi)+V_{2}(t, \varphi)$
II. $V\left(t_{k}, x+I_{k}\left(t_{k}, x\right)\right)-V\left(t_{k}^{-}, x\right) \leq 0$
III. $a V_{1}^{\prime}\left(t, x_{t}\right)+b V_{2}^{\prime}\left(t, x_{t}\right) \leq-\lambda(t) W_{3}(\inf \{|x(s)|: t-h \leq s \leq t\})$
IV. $p V_{1}^{\prime}\left(t, x_{t}\right)+q V_{2}^{\prime}\left(t, x_{t}\right) \leq 0$
where $a^{2}+b^{2} \neq 0, p^{2}+q^{2} \neq 0$ and $\int_{0}^{\infty} \lambda(s) d s=\infty$
(A) Suppose further that there is a $\mu=\mu(\gamma)>0$ for each $0<\gamma<$ $H_{1}$ such that

$$
\begin{align*}
& p V_{1}^{\prime}\left(t, x_{t}\right)+q V_{2}^{\prime}\left(t, x_{t}\right) \leq-\mu V_{1}^{\prime}\left(t, x_{t}\right)  \tag{2}\\
& \quad \text { if }|x(t)| \geq \gamma . \text { If either }(i) a>0, b>0 \text { or (ii) } p \geq 0, q
\end{align*}
$$

$>0$ hold, then the zero solution of (1)is uniformly and asymptotically stable.

E: ISSN No. 2349-9443
(B) The same is concluded if

$$
p V_{1}^{\prime}\left(t, x_{t}\right)+q V_{2}^{\prime}\left(t, x_{t}\right) \leq \mu V_{1}^{\prime}\left(t, x_{t}\right)
$$

holds in place of (2) and if either (i) $a>0, b$

$$
>0 \text { or }(i i) p>0, q>0
$$

## Proof

We first prove the uniform stability. For given $\varepsilon>0$,we may choose a $\delta=\delta(\varepsilon)>0$ such that $W_{2}(\delta)<$ $W_{1}(\varepsilon)$. For any
$\sigma \geq t_{0}$ and $\varphi \in P C_{\delta}$, let $x(t, \sigma, \varphi)$ be the solution of (1). We will prove that

$$
|x(t, \sigma, \varphi)| \leq \varepsilon, \quad t \geq \sigma
$$

Let $\quad x(t)=x(t, \sigma, \varphi)$ and $V_{1}(t)=V_{1}\left(t, x_{t}\right), V_{2}(t)=$ $V_{2}\left(t, x_{t}\right)$ and $V(t)=V\left(t, x_{t}\right)$.
Then by assumption (iv),

$$
V^{\prime}\left(t, x_{t}\right) \leq 0, \quad \sigma \leq t_{k-1} \leq t<t_{k}, \quad k \in Z^{+}
$$

and so $\mathrm{V}(\mathrm{t})$ is non increasing on the interval of the form $\left[t_{k-1}, t_{k}\right)$. From condition (ii)

$$
\begin{aligned}
& V\left(t_{k}\right)-V\left(t_{k}^{-}\right)=V\left(t_{k}, x\left(t_{k}^{-}\right)+I_{k}\left(t_{k}, x\left(t_{k}^{-}\right)\right)\right)- \\
& V\left(t_{k}^{-}, x\left(t_{k}^{-}\right)\right) \leq 0 \\
& \text { Thus } V(\mathrm{t}) \text { is non increasing on }[\sigma, \infty) . \text { We have } \\
& W_{1}(|x(t)|) \leq V(t) \leq V(\sigma) \leq W_{2}(\sigma)<W_{1}(\varepsilon) \\
& t \geq \sigma
\end{aligned}
$$

This implies with the monotonicity of $\mathrm{W}_{1},|\mathrm{x}(\mathrm{t})|<\varepsilon$ for $t \geq \sigma$ and so that the zero solution of (1) is uniformly stable.
To show asymptotic stability, for a given $t_{0} \in R_{+}$and a fixed $0<\mathrm{H}_{2}<\mathrm{H}_{1}$, take $\eta=\eta\left(\mathrm{t}_{0}\right)=\delta\left(\mathrm{t}_{0}, \mathrm{H}_{2}\right)>0$, where $\delta$ is that in the definition of stability and for a given $\varphi \in \operatorname{PC}(\eta)$, let $x(t)=x(t, \sigma, \varphi)$ be a solution of (1). Suppose for contradiction that $x(t) \nrightarrow 0$ as $t \rightarrow \infty$. Then there is a sequence $\left\{\mathrm{T}_{\mathrm{i}}\right\}$ and an $\varepsilon_{0}>0$ with $\mathrm{T}_{\mathrm{i}} \rightarrow \infty$ and $\left|\mathrm{x}\left(\mathrm{T}_{\mathrm{i}}\right)\right|>\varepsilon_{0}$. Define $\varepsilon_{2}=\mathrm{W}_{2}^{-1}\left(\frac{\mathrm{~W}_{1}\left(\varepsilon_{0}\right)}{2}\right)$ then there is a sequence $\left\{s_{i}\right\}$ with $s_{i} \rightarrow \infty$ and $\left|x\left(s_{i}\right)\right|<\varepsilon_{2}$. Otherwise there is an $S \geq t_{0}$ such that
$|x(t)| \geq \varepsilon_{2}$ for $t \geq S$ and
$\mathrm{av}_{1}(\mathrm{t})+\mathrm{bv}_{2}(\mathrm{t}) \leq$
$\mathrm{av}_{1}(\mathrm{~S}+\mathrm{h})+\mathrm{bv}_{2}(\mathrm{~S}+\mathrm{h})-\int_{\mathrm{S}+\mathrm{h}}^{\mathrm{t}} \lambda(\mathrm{s}) \mathrm{W}_{4}(\inf \{|\mathrm{x}(\sigma)|: \mathrm{s}-\mathrm{h} \leq$ $\sigma \leq s d s+$
$\mathrm{S}+\mathrm{h} \leq \mathrm{tk} \leq \mathrm{t}[\mathrm{Vtk}-\mathrm{S}+\mathrm{h} \leq \mathrm{tk} \leq \mathrm{t}[\mathrm{Vtk}-\mathrm{Vtk}-)]$

$$
\leq \mathrm{av}_{1}(\mathrm{~S}+\mathrm{h})+\mathrm{bv}_{2}(\mathrm{~S}+\mathrm{h})-\mathrm{W}_{4}\left(\varepsilon_{2}\right) \int_{\mathrm{S}}^{\mathrm{t}} \lambda(\mathrm{~s}) \mathrm{ds} \rightarrow-\infty
$$

as $t \rightarrow \infty$, which contradicts either $\operatorname{av}_{1}(t)+\mathrm{bv}_{2}(\mathrm{t}) \geq 0$ if (i) holds or

$$
\mathrm{av}_{1}(\mathrm{t})+\mathrm{bv}_{2}(\mathrm{t}) \geq-|\mathrm{a}| \mathrm{W}_{2}\left(\mathrm{H}_{2}\right)-|\mathrm{b}|\left(\mathrm{pv}_{1}\left(\mathrm{t}_{0}\right)+\right.
$$

$\left.\mathrm{qV}_{2}\left(\mathrm{t}_{0}\right)\right) / \mathrm{q}$
if (ii) holds.
In Case (A), we may assume $\mathrm{T}_{\mathrm{i}-1}<\mathrm{s}_{\mathrm{i}}<\mathrm{T}_{\mathrm{i}}$ by choosing and renumbering if necessary. Then we can take a sequence $\left\{\mathrm{t}_{\mathrm{i}}\right\}$ such that $\mathrm{s}_{\mathrm{i}}<\mathrm{t}_{\mathrm{i}}<\mathrm{T}_{\mathrm{i}},\left|\mathrm{x}\left(\mathrm{t}_{\mathrm{i}}\right)\right|=\varepsilon_{2}$ and $|\mathrm{x}(\mathrm{t})|>\varepsilon_{2}$ for $\mathrm{t}_{\mathrm{i}}<\mathrm{t} \leq \mathrm{T}_{\mathrm{i}}$.
Then $\mathrm{pv}_{1}\left(\mathrm{~T}_{\mathrm{i}}\right)+\mathrm{qv}_{2}\left(\mathrm{~T}_{\mathrm{i}}\right)-\left(\mathrm{pv}_{1}\left(\mathrm{~T}_{\mathrm{i}-1}\right)+\mathrm{qv}_{2}\left(\mathrm{~T}_{\mathrm{i}-1}\right)\right)$

$$
\leq \mathrm{pv}_{1}\left(\mathrm{~T}_{\mathrm{i}}\right)+\mathrm{qv}_{2}\left(\mathrm{~T}_{\mathrm{i}}\right)-\left(\mathrm{p} \mathrm{v}_{1}\left(\mathrm{t}_{\mathrm{i}}\right)+\mathrm{qv}_{2}\left(\mathrm{t}_{\mathrm{i}}\right)\right)
$$

$$
\begin{aligned}
& +\sum_{\mathrm{t}_{\mathrm{i}} \leq \mathrm{t}_{\mathrm{k}} \leq \mathrm{T}_{\mathrm{i}}}\left[\mathrm{~V}\left(\mathrm{t}_{\mathrm{k}}\right)-\mathrm{V}\left(\mathrm{t}_{\mathrm{k}}^{-}\right)\right] \\
& \leq-\mu\left(\varepsilon_{2}\right)\left(\mathrm{v}_{1}\left(\mathrm{~T}_{\mathrm{i}}\right)-\mathrm{v}_{1}\left(\mathrm{t}_{\mathrm{i}}\right)\right) \\
& \leq-\mu\left(\varepsilon_{2}\right) \mathrm{W}_{1}\left(\varepsilon_{0}\right) / 2
\end{aligned}
$$

and a contradiction follows from

## Asian Resonance

$p v_{1}\left(T_{n}\right)+q v_{2}\left(T_{n}\right)$
$=p v_{1}\left(T_{1}\right)+q v_{2}\left(T_{1}\right)$
$+\sum_{i=2}^{n}\left[p v_{1}\left(T_{i}\right)+q v_{2}\left(T_{i}\right)\right.$
$-\left(p v_{1}\left(T_{i-1}\right)\right.$
$+$
$+\sum_{T_{i-1} \leq t_{k} \leq T_{i}}\left[V\left(t_{k}\right)-V\left(t_{k}{ }^{-}\right)\right]$
$\leq p v_{1}\left(T_{1}\right)+q v_{2}\left(T_{1}\right)-\frac{(n-1) \mu\left(\varepsilon_{2}\right) W_{1}\left(\varepsilon_{0}\right)}{2} \rightarrow-\infty$
as $n \rightarrow \infty$
In Case (B), we may assume $s_{i-1}<T_{i}<s_{i}$ and take $\left\{t_{i}\right\}$ with $T_{i}<t_{i}<s_{i},\left|x\left(t_{i}\right)\right|=\varepsilon_{2}$ and $|x(t)|>\varepsilon_{2}$ for $T_{i} \leq t<t_{i}$ so that
$p v_{1}\left(t_{i}\right)+q v_{2}\left(t_{i}\right)-\left(p v_{1}\left(t_{i-1}\right)+q v_{2}\left(t_{i-1}\right)\right)$

$$
\begin{aligned}
\leq p v_{1}\left(t_{i}\right)+q v_{2}\left(t_{i}\right) & -\left(p v_{1}\left(T_{i}\right)+q v_{2}\left(T_{i}\right)\right) \\
& +\sum_{T_{i} \leq t_{k} \leq t_{i}}\left[V\left(t_{k}\right)-V\left(t_{k}^{-}\right)\right]
\end{aligned}
$$

$$
\leq \mu\left(\varepsilon_{2}\right)\left(v_{1}\left(t_{i}\right)-v_{1}\left(T_{i}\right)\right)
$$

$$
\leq-\mu\left(\varepsilon_{2}\right) W_{1}\left(\varepsilon_{0}\right) / 2
$$

This implies a contradiction by the same argument as in case (A)
Therefore, $x(t) \rightarrow 0$ as $t \rightarrow \infty$. The proof is complete.

## Theorem 2.

Assume that there exist $V_{1}, V_{2} \in v_{0}($.$) and$
$W_{1}, W_{2}, W_{3}, W_{4} \in \Re$ such that
a) $\quad W_{1}|\varphi(0)| \leq V(t, \varphi) \leq W_{2}|\varphi(0)|$ where $V(t, \varphi)=$ $V_{1}(t, \varphi)+V_{2}(t, \varphi)$
b) $V\left(t_{k}, x+I_{k}\left(t_{k}, x\right)\right)-V\left(t_{k}{ }^{-}, x\right) \leq 0, k \in Z^{+}$
c) $a V_{1}^{\prime}\left(t, x_{t}\right)+b V_{2}^{\prime}\left(t, x_{t}\right) \leq$
$-\lambda(t) W_{3}(\inf \{|x(s)| ; t-h \leq s \leq t\})$
and $\quad p V^{\prime}{ }_{1}\left(t, x_{t}\right)+q V^{\prime}{ }_{2}\left(t, x_{t}\right)$ $\leq 0$
Where $a^{2}+b^{2} \neq 0, p^{2}+q^{2} \neq 0$ and

$$
\lim _{S \rightarrow \infty} \int_{t}^{t+S} \lambda(s) d s=\infty \text { uniformly in } t \in R_{+}
$$

A. Suppose that there is a $\mu=\mu(\gamma)>0$ for each
$0<\gamma<H_{1}$ such that

$$
\begin{align*}
& p V_{1}^{\prime}\left(t, x_{t}\right)+q V_{2}^{\prime}\left(t, x_{t}\right) \\
& \leq-\mu V_{1}^{\prime}\left(t, x_{t}\right) \tag{3}
\end{align*}
$$

If $|x(t)| \geq \gamma$. If either (i) $a>0, b \geq 0$ or (ii)
$p \geq 0, q \geq 0$ hold, then the zero solution of (1)
is uniformly asymptotically stable.
B. The same is concluded if (3) is replaced by

$$
\begin{aligned}
& p V_{1}^{\prime}\left(t, x_{t}\right)+q V_{2}^{\prime} \\
& \leq \mu V_{1}^{\prime}\left(t, x_{t}\right)
\end{aligned}
$$

And if either (i) $a>0, b \geq 0$ or (ii) $p>0, q \geq 0$ hold

## Proof

Uniform Stability can be proven as stability in Theorem 1.
Set $\eta=\delta\left(H_{2}\right)$ for a fixed $0<H_{2}<H_{1}$ and $\delta$ in the definition of uniform stability. For given $t_{0} \in R_{+}, \varphi \in C_{\eta}$, let $x(t)=x(t, \sigma, \varphi)$ be a solution of (1). Let $\varepsilon>0$ be given and take $\delta=\delta(\varepsilon)>0$ of uniform stability. Define $\delta_{1}=W_{2}^{-1}\left(\frac{W_{1}(\delta)}{2}\right)$. Choose a $S=S(\varepsilon)>0$ with

$$
\int_{t}^{t+S} \lambda(s) d s>2\left(|a| W_{2}\left(H_{2}\right)+|b| W_{3}\left(H_{2}\right)\right) / W_{4}\left(\delta_{1}\right)
$$

For $t \in R_{+}$and an integer $N=N(\varepsilon) \geq 1$ with $N \mu\left(\delta_{1}\right) W_{1}(\delta) / 2>2\left(|p| W_{2}\left(H_{2}\right)+|q| W_{3}\left(H_{2}\right)\right)$

E: ISSN No. 2349-9443

Define $\quad T=T(\varepsilon)=N(S+2 h)$. Suppose, for contradiction, that $\left\|x_{t}\right\| \geq \delta$ for $t_{0} \leq t \leq t_{0}+T$.
In Case (A), for $1 \leq i \leq N$, there is a $+(i-1)(S+2 h) \leq s_{i} \leq t_{0}+(i-1)(S+2 h)+h+S$ With $\left|x\left(s_{i}\right)\right|<\delta_{1}$. Otherwise $|x(t)| \geq \delta_{1}$ on this interval and, for $I_{i}=\left[t_{0}+(i-1)(S+2 h)+h, t_{0}+(i-1)(S+\right.$ $2 h+h+S, v 1 t=V 1(t, x t)$ and $v 2 t=V 2(t, x t)$, we have

$$
\begin{aligned}
& -2\left(|a| W_{2}\left(H_{2}\right)+|b| W_{3}\left(H_{2}\right)\right) \\
& \quad \leq a v_{1}\left(t_{0}+(i-1)(S+2 h)+h+S\right)+b v_{2}\left(t_{0}\right. \\
& \quad+(i-1)(S+2 h)+h+S) \\
& \left(-a v_{1}\left(t_{0}+(i-1)(S+2 h)+h\right)+b v_{2}\left(t_{0}+\right.\right. \\
& (i-1)(S+2 h)+h)) \\
& \leq-\int \lambda(t) W_{4}(\inf \{|x(s)|: t-h \leq s \leq t\}) d s \\
& \leq-W_{4}\left(\delta_{1}\right) \int \lambda(t)<-2\left(|a| W_{2}\left(H_{2}\right)+|b| W_{3}\left(H_{2}\right)\right)
\end{aligned}
$$

This inequality also holds true as per condition (ii)
a contradiction.
From the supposition, for $1 \leq i \leq N$, there is a $t_{0}+(i-1)(S+2 h)+h+S \leq T_{i} \leq t_{0}+i(S+2 h)$
Such that $\left|x\left(T_{i}\right)\right| \geq \delta$. Thus, there is an $s_{i}<t_{i}<T_{i}$ with
$\left|x\left(t_{i}\right)\right|=\delta_{1}$ and $|x(t)|>\delta_{1}$ for $t_{i}<t \leq T_{i}$. We obtain

$$
\begin{aligned}
& \quad p v_{1}\left(t_{0}+i(S+2 h)\right)+q v_{2}\left(t_{0}+i(S+2 h)\right) \\
& \\
& \quad-\left(p v_{1}\left(t_{0}+(i-1)(S+2 h)\right)\right. \\
& \left.\quad+q v_{2}\left(t_{0}+(i-1)(S+2 h)\right)\right) \\
& \leq p v_{1}\left(T_{i}\right)+q v_{2}\left(T_{i}\right)-\left(p v_{1}\left(t_{i}\right)+q v_{2}\left(t_{i}\right)\right) \\
& \leq-\mu\left(\delta_{1}\right)\left(v_{1}\left(T_{i}\right)-v_{1}\left(t_{i}\right)\right) \leq-\mu\left(\delta_{1}\right) W_{1}(\delta) / 2
\end{aligned}
$$

$-2\left(|p| W_{2}\left(H_{2}\right)+|q| W_{3}\left(H_{2}\right)\right) \leq p v_{1}\left(t_{0}+N(S+2 h)\right)+$
$q v_{2}\left(t_{0}+N(S+2 h)\right)-\left(p v_{1}\left(t_{0}\right)+q\left(v_{2}\left(t_{0}\right)\right)\right.$
$=\sum_{i=1}^{N}\left(p v_{1}\left(t_{0}+i(S+2 h)\right)+q v_{2}\left(t_{0}+i(S+2 h)\right)\right)-$ ( $p v 1 t 0+i-1 S+2 h+q v 2 t 0+i-1 S+2 h$ )
$\leq-N \mu\left(\delta_{1}\right) W_{1}(\delta) / 2<-2\left(|p| W_{2}\left(H_{2}\right)+|q| W_{3}\left(H_{2}\right)\right)$,
This inequality also holds true as per condition (ii) a contradiction.
In Case (B), we can take, for $1 \leq i \leq N, t_{0}+$ $(i-1)(2 h+S)+h \leq s_{i} \leq t_{0}+i(2 h+S)$ with $\left|x\left(s_{i}\right)\right|<$ $\delta_{1}, \quad t_{0}+(i-1)(2 h+S) \leq T_{i} \leq t_{0}+(i-1)(2 h+S)+$ $h$ with $\left|x\left(T_{i}\right)\right| \geq \delta$ and $T_{i}<t_{i}<s_{i}$ with $\left|x\left(t_{i}\right)\right|=\delta_{1}$, $|x(t)|>\delta_{1}$ for $T_{i} \leq t<t_{i}$ so that

$$
\begin{aligned}
p v_{1}\left(t_{0}+i(S+2 h)\right) & +q v_{2}\left(t_{0}+i(S+2 h)\right) \\
& -\left(p v_{1}\left(t_{0}+(i-1)(S+2 h)\right)\right. \\
& \left.+q v_{2}\left(t_{0}+(i-1)(S+2 h)\right)\right)
\end{aligned}
$$

$$
\leq p v_{1}\left(t_{i}\right)+q v_{2}\left(t_{i}\right)-\left(p v_{1}\left(T_{i}\right)+q v_{2}\left(T_{i}\right)\right)
$$

$$
\leq \mu\left(\delta_{1}\right)\left(v_{1}\left(t_{i}\right)-v_{1}\left(T_{i}\right)\right) \leq-\mu\left(\delta_{1}\right) W_{1}(\delta) / 2
$$

This inequality also holds true as per condition (ii) a contradiction follows from this as in case(A)

Consequently $\left\|x_{t^{\prime}}\right\|<\delta$ for some $t_{0} \leq t^{\prime} \leq t_{0}+T$ and $|x(t)|<\varepsilon$ for $t \geq t_{0}+T$. This completes the proof.
Corollary
If there are $V_{1}, V_{2} \in v_{0}($.$) and W_{1}, W_{2}, W_{3}, W_{4} \in \Re$ satisfying
a) $\quad W_{1}|\varphi(0)| \leq V(t, \varphi) \leq W_{2}|\varphi(0)|$
b) $0 \leq V(t, \varphi) \leq W_{3}(\|\varphi\|)$ where $V(t, \varphi)=$ $V_{1}(t, \varphi)+V_{2}(t, \varphi)$
c) $V\left(t_{k}, x+I_{k}\left(t_{k}, x\right)\right)-V\left(t_{k}^{-}, x\right) \leq 0$
d) $V_{1}^{\prime}\left(t, x_{t}\right)+c_{1} V_{2}^{\prime}\left(t, x_{t}\right) \leq 0$
e) $\quad V_{1}^{\prime}\left(t, x_{t}\right)+c_{2} V_{2}^{\prime}\left(t, x_{t}\right) \leq$

$$
-\lambda(t) W_{4}(\inf \{|x(s)| ; t-h \leq s \leq t\})
$$

Where $c_{1} \neq c_{2}$ either $c_{1} \geq 0$ or $c_{2} \geq 0$ and $\lim _{S \rightarrow \infty} \int_{t}^{t+S} \lambda(s) d s=\infty$ uniformly in $t \in R_{+}$

## Asian Resonance

Then the zero solution of (1) is uniformly asymptotically stable.
Proof
We may assume that $c_{1}>c_{2}$. Then $c_{1} \geq 0$, if
$c_{2}=0$

$$
V_{1}^{\prime}\left(t, x_{t}\right)+c_{1} V_{2}^{\prime}\left(t, x_{t}\right) \leq 0 \leq-V_{1}^{\prime}\left(t, x_{t}\right)
$$

And the conditions of theorem 2(A ii) are satisfied.
If $c_{1}>0$

$$
\begin{aligned}
V_{1}^{\prime}\left(t, x_{t}\right)+c_{1} V_{2}^{\prime}\left(t, x_{t}\right) & \leq\left(c_{1}-c_{2}\right) V_{2}^{\prime}\left(t, x_{t}\right) \\
& \leq-\left(\frac{\left(c_{1}-c_{2}\right)}{c_{1} \ldots}\right) V_{1}^{\prime}\left(t, x_{t}\right)
\end{aligned}
$$

Implies uniform stability by Theorem 2(A ii).
Example Consider the impulsive differential equation

$$
\begin{gathered}
x^{\prime}(t)=-a(t) f(x(t))+b(t) g(x(t-h)) \\
x\left(t_{k}\right)-x\left(t_{k}^{-}\right)=c_{k} x\left(t_{k}^{-}\right), \quad k \in Z^{+}
\end{gathered}
$$

Where $\quad a: R_{+} \rightarrow R_{+}, b: R_{+} \rightarrow R, f, g: R \rightarrow R \quad$ are continuous, $\quad x f(x)>0$, for $x \neq 0,|g(x)| \leq c|f(x)|$ for $c>0$ and $g(x) \neq 0$ for $x \neq 0, \quad\left|1+c_{k}\right| \leq 1, k \in Z^{+}$and $\sum_{k=1}^{\infty}\left[1-\left|1+c_{k}\right|\right]=\infty$
If $\int_{t}^{t+h}|b(s)| d s$ is bounded, $a(t)-\alpha c|b(t+h)| \geq 0$
For some $\alpha>1$, and for some $1 \leq \beta \leq \alpha, \lambda(t)=a(t)-$ $\beta c|b(t+h)|+(\beta-1)|b(t)|$ satisfies

$$
\lim _{s \rightarrow \infty} \int_{t}^{t+S} \lambda(s) d s=\infty
$$

Uniformly in $t \in R_{+}$, then the zero solution is uniformly asymptotically stable.

## Proof

Let $V=V_{1}+V_{2} \quad$ where $\quad V_{1}(\mathrm{t}, \varphi)=|\varphi(0)|, \quad V_{2}(t, \varphi)=$ $\int_{-h}^{0}|b(t+s+h)| \mid g(\varphi(s) \mid d s$
Then $V_{2}(t, \varphi) \leq \int_{t}^{t+h}|b(s)| d s W_{3}(\|\varphi\|)$ for some function $W_{3} \in \Re$
And $\quad V_{1}\left(t_{k}, x+c_{k} x\right)-V_{1}\left(t_{k}{ }^{-}, x\right)=\left|\left(1+c_{k}\right) x\right|-|x|=$ $\left[1-\left|1+c_{k}\right|\right] V\left(t_{k}{ }^{-}, x\right)$
Let $\lambda_{\mathrm{k}}=1-\left|1+\mathrm{c}_{\mathrm{k}}\right|$; then $\sum_{\mathrm{k}=1}^{\infty} \lambda_{\mathrm{k}}=\infty$. We check that for any $\alpha>0$, there is a $\beta>0$ such that $V\left(t, x_{t}\right) \geq \alpha$ implies $V_{1}\left(t, x_{t}\right) \geq \beta$.
Otherwise we must have $\liminf _{\mathrm{t} \rightarrow \infty} \mathrm{V}_{1}\left(\mathrm{t}, \mathrm{x}_{\mathrm{t}}\right)=0$
We let $V(t)=V_{1}\left(t, x_{t}\right)+V_{2}\left(t, x_{t}\right)$
Then $\quad V\left(t_{k}\right)-V\left(t_{k}{ }^{-}\right)=V_{1}\left(\mathrm{t}_{\mathrm{k}}, \mathrm{x}\left(\mathrm{t}_{\mathrm{k}}{ }^{-}\right)+\mathrm{c}_{\mathrm{k}} \mathrm{x}\left(\mathrm{t}_{\mathrm{k}}{ }^{-}\right)\right)-$
$\mathrm{V}_{1}\left(\mathrm{t}_{\mathrm{k}}{ }^{-}, \mathrm{x}\left(\mathrm{t}_{\mathrm{k}}{ }^{-}\right)\right) \leq 0$

$$
v_{1}^{\prime}\left(t, x_{t}\right)+\beta v_{2}^{\prime}\left(t, x_{t}\right)
$$

$$
\leq-(\mathrm{a}(\mathrm{t})-\beta \mathrm{c}|\mathrm{~b}(\mathrm{t}+\mathrm{h})|)|\mathrm{f}(\mathrm{x}(\mathrm{t}))|
$$

$$
-(\beta-1)|b(t)||g(x(t-h))|
$$

$$
+\sum_{0 \leq t_{\mathrm{k}} \leq \mathrm{t}} \mathrm{~V}\left(\mathrm{t}_{\mathrm{k}}\right)-\mathrm{V}\left(\mathrm{t}_{\mathrm{k}}^{-}\right)
$$

$$
\leq-\lambda(t) W_{4}(\inf \{|x(s)|: t-h \leq s \leq t\})
$$

If $\left\|\mathrm{x}_{\mathrm{t}}\right\| \leq \mathrm{H}$ for a fixed $0<H<\infty$ and some function $\mathrm{W}_{4}$.
If $\beta=1$, for $\alpha \neq 1 \quad V_{1}^{\prime}\left(t, x_{t}\right)+\alpha V_{2}^{\prime}\left(t, x_{t}\right) \leq 0$
If $\beta>1 \quad V_{1}^{\prime}\left(t, x_{t}\right)+1 V_{2}^{\prime}\left(t, x_{t}\right) \leq 0$
The conditions of the corollary are satisfied and hence the zero solution is uniformly asymptotically stable.
