W.B., India

Abstract

Ramnagar College is situated at the lap of the Bay of Bengal. The climate of this region is of tropical type. Though the seasonal variation is not sound enough, there develops a wide spectrum of habit groups. Present communications recorded altogether 170 species (wild 128 & planted 42) of angiosperms (144 dicots & 26 monocots) under 151 genera (126 dicots & 25 monocots) and 64 families (48 dicots & 16 monocots) from this campus. The ratio of monocots and dicots is 1: 5.53. The percentage of herbs, shrubs, trees, Twiners, Tendril climbers, Scramblers, Ramblers and Liana is 43.52%, 12.35%, 25.89%, 8.82%, 4.11%, 3.52 %, 1.17% and 0.59% respectively. The dominant families in the campus are Acanthaceae, Amaranthaceae, Apocynaceae, Araceae, Arecaceae, Asteraceae, Cucurbitaceae, Euphorbiaceae, Fabaceae, Moraceae, Rubiaceae and Verbenaceae. Species showing poor frequency are: *Streblus asper*, *Solanum trilobatum*. Fast growing invasion of alien weeds i.e. *Argemone mexicana*, *Blumea lacera*, *Mikania micrantha*, *Parthenium hysterophorus* are causing major threats to the normal growth of the other plant species in this campus. Among the important medicinal herbs, *Andrographis paniculata*, *Hydrocotyle asiatica* and *Hygrophila auriculata* etc are common in the campus. From germplasm conservation point of view ornamental and medicinal gardens have already been established within the campus. Generally the vegetation pockets are the major source of information for the preparation of data bank of flora, rare, endangered, keystone species, etc. So overall information collected from vegetation survey the Academicians, Researchers as well as Conservators can be benefitted to a certain extent for their further studies.

Keywords: Documentation, Floristic Elements, Conservation.

Introduction

To know the floristic elements at Ramnagar College Campus and the same time for their documentation an initiative has been taken. Vegetation survey is one of the best methods to know the floral components of a particular area or a region. This information ultimately gives the sphere to construct a data bank and subsequently this data bank will be utilised for the preparation of district, state and regional flora, etc.

Literature survey reflects that a number of workers, plant explorers, researchers have done their works from time to time from Midnapore districts [Mukherjee & Banerjee, 1968; Rao et al., 1970; Maji & Sikdar, 1983; De, 2002; Samanta & Panda, 2011; Das & Samanta, 2006; Das, 2009; Das & Ghosh, 2014; Das, 2017; Pal & Jain, 1998; Samanta & Das, 2003; Bhakat, 2003; Bhakat & Sen, 2015; Pant et al., 1993; Paria, 2005; Samanta & Biswas, 2009; Sasmal et al., 2009; Panda & Samanta, 2012, 2014; Samanta & Panda, 2012, 2016; Bhakta, 2017]. Present initiatives have been taken as prerequisite for the formation of coastal zone flora.

Study Area

For the preparation of overall floristic database, Ramnagar College Campus covering an area of (7927, sq Mts.) was selected as study area. Ramnagar College is situated in between 21.7182° N latitude and 87.5581° E longitudes near by the Bay of Bengal.

The soil of Purba Medinipur district is alluvial type. The maximum temperature varies in the district from 34°C to 44°C during summer and comes down to 9°C during winter. The average annual rainfall is of 1600

E: ISSN No. 2349-9435

mm. Climate is of tropical type. The climatic set up, physiographic condition etc favours there the formation of a flora of diversified plant groups.

Materials and Methods

Field Survey

Collection of specimens at Ramnagar college campus was done during the year 2017-2019 [at least three times in a year i. e. premonsoon (February to May); monsoon (June-September) and post monsoon (October-January) to record the flowering and fruiting periods] for the preparation of comprehensive database of angiosperms. After the collection, the specimens were properly identified with the relevant literatures of Hooker, 1872-1897; Prain, 1903; FWB, 1997; Haines, 1921-1925; Paul, et al., 2015; Ranjan, et al., 2016. Field and herbarium methods were followed according to Jain and Rao (1977). Finally the voucher specimens were deposited at Ramnagar College Herbarium. For updating species names the website of The Plant List

**Fig.-1: Numerical break up of taxa according to their habit groups occurring at Ramnagar College Campus.**

With the keen review it was revealed that out of recorded 170 plant species at Ramnagar College Campus, only 74 species are herbs, 21 species are shrubs, 44 species are trees, 15 species are twiners,

7 species are tendril climbers, 6 species are scramblers, 2 species are ramblers and only 1 species is liana (Fig.-2).

**Fig.-2: Numerical break up of taxa according to their habit groups occurring at Ramnagar College Campus**

Regarding the flowering and fruiting periods 3 sessions have been selected i.e. Pre-monsoon, Monsoon and Post-monsoon. From this calendar it was found that in Pre-monsoon total 363 species show flowering and fruiting periods, out of which 83 species in February, 94 species in March, 88 species in April and 98 species in May. In the Monsoon periods there are 435 species show flowering and fruiting activity, out of which 99 species in June, 102 species in July, 114 species in August and 120

species in September. In Post-monsoon periods only 407 species show flowering and fruiting activities, out of which 120 species in October, 110 species in November, 104 species in December and 73 species in January. From the above observation it was concluded that the species showing highest flowering and fruiting activities in monsoon season (in both the months September and October) followed by post-monsoon season and pre-monsoon season (in between January and February) [Fig-3a & 3b].

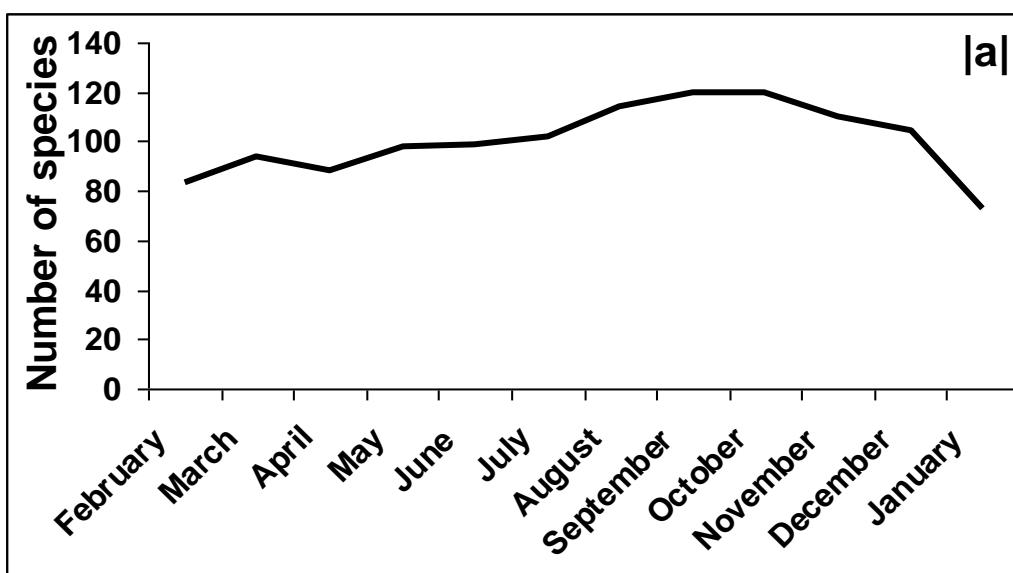

Fig.-3a: Showing Flowering and fruiting periods monthwise as against their numbers.

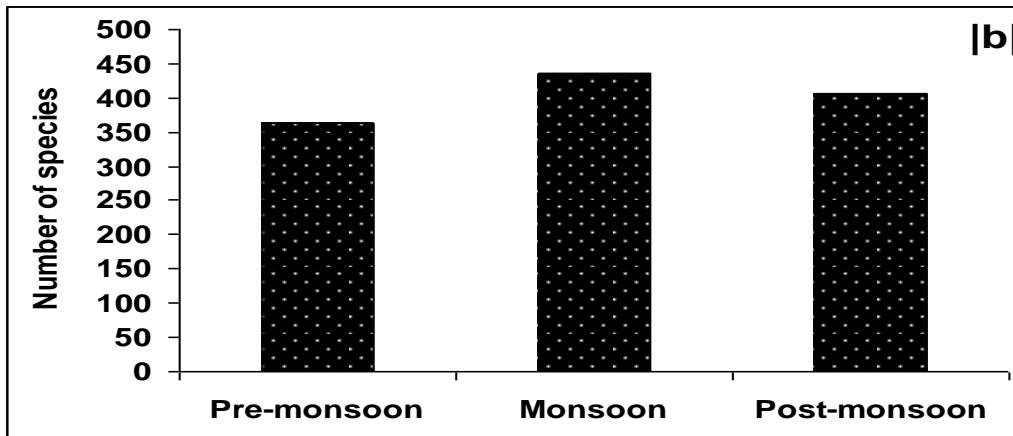

Fig.-3b: Showing Flowering and fruiting periods in Pre-monsoon, Monsoon and Post- monsoon as against their total numbers of species.

In general the survival of the species is carried out by the process of reproduction. They can reproduce following different methods (Table-1a & 1b). From the above survey report it was found that out of 170 species, only 125 species reproduces by the agent of seed; 10 species through seeds and root-stocks; 16 species by seeds and stem cuttings; 6 species each by root-stocks and rhizomes; 5 species by stem cuttings and other 1 species each through leaf-cuttings and seeds and rhizome.

Out of recorded 48 families, 10 dominant families showing their highest number of genus and species. In the (Table-2) regarding the number of species and genus, it was found that the family Fabaceae is scoring highest (20/16) followed by Asteraceae (11/11); Verbenaceae (9/10); Acanthaceae and Euphorbiaceae (6/7); Amaranthaceae (4/7); Apocynaceae (6/6); Moraceae and Rubiaceae (3/5); Araceae and Arecaceae (4/4); Solanaceae (2/4) and Cucurbitaceae (3/4).

In this survey, there reports 30 alien species (Table-3). Out of which, 19 species are the native places of America; 3 species from Brazil; 2 species

from Australia and 1 each from Mexico, Madagascar, Afro-Asia, Tropical Africa, Malagasy and from the Old world.

Regarding the aquatic plants, 9 species were recorded from this campus. They are *Eichhornia crassipes*, *Enydra fluctuans*, *Hygrophila auriculata*, *Ipomoea aquatica*, *Ludwigia adscendens*, *Monochoria hastata*, *Nymphaea nouchali*, *Polygonum chinensis* and *Vallisneria spiralis* (Table-1a & 1b).

Conclusion

As the vegetation plays a key role for maintaining the stability of an ecosystem but also the major sources of food, fodder, medicines, building goods, fuels, etc. So information gathers from vegetation survey the Academicians, Researchers as well as Conservators can be benefitted to a certain extent for their further studies. On critical observation it was found that some of the species are not existed in this campus, due to the expansion of the institutional buildings, unauthorised grazing, calamities like super cyclones and also abrupt climate change etc possibly are the prime factors for their gradual disappearance. For the interests of a

E: ISSN No. 2349-9435

sustainable development, existence of future generation, rare, endangered and economically potent species should be maintained in different way I suggest the establishment of a Germplasm Preservation Centre (*ex-situ* or *in situ* conservation) within this campus.

Acknowledgements

Thanks to the Principal of Ramnagar College for giving permission and full support to the author to use the laboratory for doing this work. Sincere thanks are also to Dr. Susanta Kumar Maity, Assistant Professor of Botany, Government General Degree College, Keshiary for his constant inspirations and suggestions for the completion of this paper.
